CONTAINER CHEAT SHEET

`podman run -d -p 8080:80 nginx`
Run a container rootless — no daemon needed.

`podman pull opensuse/tumbleweed`
Grab an official openSUSE base image.

`podman ps -a`
See what's running — and what stopped.

`podman auto-update`
Pull new images and restart labelled containers.

`~/.config/containers/systemd/`
Drop Quadlet files here to run containers as services.

`sudo transactional-update pkg in htop`
Add a host package without breaking immutability.

`sudo transactional-update rollback`
Return to the last known-good host state.

`distrobox create -i tumbleweed`
A mutable toolbox on an immutable host.
