01 · SET UP

A dev box in minutes.

`sudo zypper in -t pattern devel_basis`
Compilers, make and the core build tools in one go.

`sudo zypper in git osc`
Version control plus the Build Service client.

`sudo zypper si -d <pkg>`
Install everything needed to build a package from source.

`distrobox create -i leap`
Test against stable Leap while you develop on Tumbleweed.

`zypper wp <file>`
Which package provides a missing header or library?

02 · PACKAGE

Ship with the Build Service.

`osc mkpac <name>`
Create a new package in your home project.

`osc build`
Build locally in a clean, reproducible root.

`osc commit -m "…"`
Upload — OBS builds for every target you enabled.

`osc results`
See build status per distro and architecture.

`osc buildlog <repo> <arch>`
Read the full log when a build fails.

03 · CONTRIBUTE

Get it into the distro.

`osc branch openSUSE:Factory <pkg>`
Fork a Tumbleweed package to improve it.

`osc vc`
Write the changelog entry reviewers expect.

`osc submitrequest`
Send it for review - openQA tests it before release.

`osc rq list -M`
Track the requests you've sent.
